

INTRODUCING SMARTWATER

Information for the general public

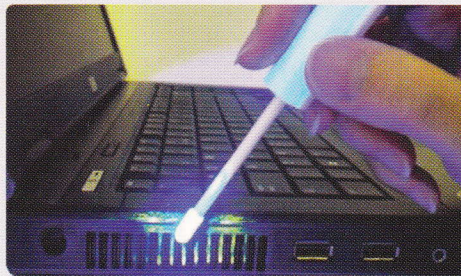

SmartWater's cutting edge forensic products are manufactured and distributed by SmartWater CSI LLC, based in Fort Lauderdale, Florida. SmartWater products are used strategically across a broad range of sectors to deter, detect and deflect criminal activity.

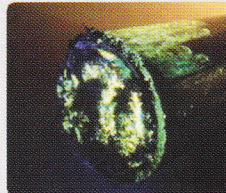

SmartWater products are colorless, chemically-coded solutions that fluoresce yellow under ultra-violet (UV) black light. Once applied to an item, SmartWater provides traceability for that item and undeniable proof of ownership. Not only do SmartWater products link property to the rightful owner they can also link criminals back to a specific crime scene. The two most widely used types of SmartWater are:

SmartWater Forensic Property Coding

Every bottle carries its own chemical 'code' which is registered to an address or location. The solution can be used to mark anything from commercial assets and infrastructure, such as IT equipment or copper roofing, to personal possessions such as jewelry or hobby items. More robust than DNA-based markers, SmartWater is almost impossible to remove once applied. Only the tiniest amount of SmartWater is needed for analysis in order to prove the owner of a marked item and whether it is stolen.

SmartWater Forensic Spray System

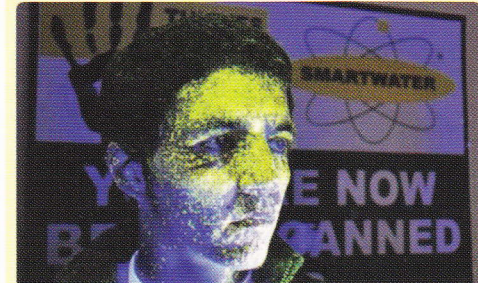

This system is used to convict criminals by spraying them with an invisible liquid which marks their skin or clothing with a forensic code assigned to a particular location. The SmartWater spray will stay on skin for weeks and for even longer on clothing and footwear. It can be used to link a criminal to a particular crime, remaining detectable long after the crime has been committed. Currently this system is used exclusively within Police-led covert operations to capture persistent offenders.
